Why CybX?

Solutions use
proprietary encryption
strategies

Combined 55 years' experience of
leadership and innovation in data and
data center protection

Trusted, reliable solutions.
Located in a secure facility in
McKeesport PA.

CybX holds six immune
architecture patents

Solutions You Can Trust

CybX solutions are developed in line with:

ISO

- International Organization for Standardization.

NIST

- National Institute of Standards and Technology.

ANSI

- American National Standards Institute.

CIS

- Computer Information Science.

The Problem

- 90% of all webpages contain trackers, and load 2x slower. Additionally, 60% of page load speed is used by ad scripts.
- When employees access the internet via a web browser, they are immediately being tracked by websites, data brokers and ad tracking servers.

Our Solution

- **Flare Browser** is an easy-to-use and highly flexible solution to give any computer user the best possible protection and control. With a single, simple installation in your browser, you can block ads, trackers, unwanted cookies, web beacons, and related analytics technologies to protect your online identity.
- **Flare Browser** enables you to remove negative factors almost completely.
- **Flare Browser** prevents data from being tracked, stored or reported.

Why Flare Browser?

- **Ad Blocking:** Flare Browser Controller enables you to block intrusive and distracting ads, it also identifies “fake” ads which lead to websites that contain spyware, viruses and adware. These features greatly enhance the speed and security of your browser.
- **Data Broker Blocking:** Data brokers gather, collate and sell information about website visitors and users. Flare Browser takes back control for the user, and blocks any and all associated IP addresses, websites, and URLs that are classified as data brokers.
- **Tracker Blocking:** Flare Browser Controller has been developed to recognize and block trackers, making your browser session as private as possible.
- **Word Blacklist:** You may want to prevent certain websites being visited on your device. A word blacklist enables you to enter unlimited words and phrases that you deem unsuitable, and Flare Browser Controller will ensure no websites can be browsed if they contain those words.
- **User Agent Spoofing:** Flare Browser Controller automatically makes very small changes to your default user agent-header each time you visit a new webpage. This default action reduces the risk of the web server identifying you and tracking your internet activity.

Take Control of Your Privacy Today!

Our licensing options are flexible and focused on results. We will put together a plan to deploy Flare Browser Controller throughout your organization in the most affordable way possible, with seamless integration.

AVAILABLE FOR CHROME BROWSER AND FIREFOX
